## US-India Nuclear Deal Fuels an Asian Arms Race

By Pervez Hoodbhoy

For all who have opposed Pakistan's nuclear program over the years -

including myself - the US-India nuclear agreement may be the

worst thing that has happened in a long time.

Post agreement: Pakistan's ruling elite is confused and bitter. They

know that India has overtaken Pakistan in far too many areas for there

to be any reasonable basis for symmetry. They see the US is now

interested in reconstructing the geopolitics of South Asia and in

repairing relations with India, not in mollifying Pakistani grievances.

Nevertheless, there were lingering hopes of a sweetener during President

George W. Bush's furtive and unwelcomed visit in March 2006 to

Islamabad. There was none.

This change in US policy thrilled many in India. Many enjoyed President

Musharraf's discomfiture. But they would do well to restrain their

exuberance. The nuclear deal, even if ratified, will not dramatically

increase nuclear power production – currently this stands at only 3% of

the total production, and can at most double to 6% if currently planned

reactors are built and made operational over the next decade. On the

other hand, Pakistan is bound to react - and

react badly - once US

nuclear materials and equipment starting rolling into India.

One certain consequence will be more bombs on both sides of the border.

The deal is widely seen in Pakistan as signaling America's support or

acquiescence, or perhaps even surrender, to India's nuclear ambitions.

India will be freely able to import uranium fuel for its safeguarded

civilian reactors. This will free up the remainder of its scarce uranium

resources for making plutonium. Further, when India's thorium-fuelled

breeder reactors are fully operational, India will be able to produce

more bombs in one year than in the last 30.

Not surprisingly, important voices in Pakistan have started to demand

that Pakistan match India bomb-for-bomb. Abdus Sattar, ex-foreign

minister of Pakistan, advocates "replication of the Kahuta plant to

produce more fissile uranium.... to rationalize and upgrade Pakistan's

minimum deterrence capability". He has also written about the need to

"accelerate its [Pakistan's] missile development programme".

This is a prescription for an unlimited nuclear race, given that "minimum

deterrence" is essentially an open-ended concept. Pakistan has mastered

centrifuge technology, and giving birth to more Kahutas would require

only a political decision. Moreover, unlike

India, Pakistan is not

constrained by supplies of natural uranium. Thus, at least in principle,

Pakistan can increase its bomb production considerably.

Although nuclear hawks in India and Pakistan had once pooh-poohed the

notion of an arms race, there is little doubt that India and Pakistan

are solidly placed on a Cold War trajectory. As more bombs are added to

the inventory every year, and intermediate range ballistic missiles

steadily roll off the production lines, both countries seek ever more potent weaponry.

Many years ago, the nuclear powers crossed the point where they

could lay cities to waste and kill millions in a matter of minutes.

The fantastically cruel logic, known as nuclear deterrence, requires only

the certainty that one nuclear bomb will be able to penetrate the

adversary's defences and land in the heart of a city. No one has the

slightest doubt that this capability was crossed multiple times over

during the past few decades.

What action would best serve the interest of the peoples of India and Pakistan, as well as of China?

A fissile material cutoff is the easiest and most straightforward way to

ease nuclear tensions. It offers the best hope to limit the upwards

spiral in warhead numbers. Instead of threatening to create more

Kahutas, Pakistan should offer to stop production of highly enriched

uranium while India should respond by ceasing to reprocess its reactor

wastes. Previous stockpiles possessed by either

country should not be

brought into issue because their credible verification is extremely

difficult and would inevitably derail an agreement. Years of negotiation

at the Conference on Disarmament in Geneva came to naught for this very

reason. A series of "Nuclear Risk Reduction" talks between Pakistan and

India have also produced zero results. The cessation of fissile material

production is completely absent from the agenda; it must be made a central item now.

The arms race directly benefits Indian and Pakistan elites. Hence they

are tacit collaborators as they woo the US and prove that their states

belong to the community of "responsible nuclear states" that are worthy

of military and nuclear assistance. The past has been banished by an

unwritten agreement. Retired Pakistani and Indian generals and leaders

meet cordially at conferences around the world and happily clink glasses

together. They emphatically deny that the two countries had even come

close to a nuclear crisis in the past. Being now charged with the

mission of projecting an image of "responsibility" abroad, none amongst them wants to bring back the memory of South Asian leaders hurling ugly

nuclear threats against each other.

But instances of criminal nuclear behaviour are to be found even in the

very recent past. For example, India's Defence Minister George Fernandes

told the International Herald Tribune on June 3, 2002 that "India can

survive a nuclear attack, but Pakistan cannot." Indian Defence Secretary

Yogendra Narain had taken things a step further in an interview with

Outlook Magazine: "A surgical strike is the answer," adding that if this

failed to resolve things, "We must be prepared for total mutual

destruction." On the Pakistani side, at the peak of the 2002 crisis.

General Musharraf had threatened that Pakistan would use "unconventional means" against India if necessary.

Tense times may return at some point in the in the future. But Indian

and Pakistani leaders are likely to once again abdicate their own

responsibilities whenever that happens. Instead, they will again entrust disaster prevention to the US.

Of course, it would be absurd to lay the blame on the US for all that

has gone wrong between the two countries. Surely the US does not want to

destabilize the subcontinent, and it does not want a South Asian

holocaust. But one must be aware that for the US this is only a

peripheral interest - the core of its interest in South Asian nuclear

issues stems from the need to limit Chinese power and influence, fear of

Al-Qaida and Muslim extremism, and the associated threat of nuclear terrorism.

The Americans will sort out their business and priorities as they see

fit. But it is unwise to participate in a plan that leaves South Asian

neighbours at each others throats while

benefiting a power that sits on the other side of the globe.

Regional tensions will increase because of the deal. Given that the

motivation for the US-India nuclear agreement comes partly from the US

desire to contain China, the Pakistan-China strategic relationship will

be considerably strengthened. In practical terms, this may amount to

enhanced support for Pakistan's missile program, or even its military

nuclear program. Speaking at Pakistan's National Defense College in

Islamabad a day before Bush's arrival there, Musharraf declared that "My

recent trip to China was part of my effort to keep Pakistan's strategic options open."

By proceeding with the nuclear deal with India the US may destabilize

South Asia. It will also wreck the NPT, take the heat off Iran and North

Korea, open the door for Japan to convert its plutonium stocks into

bombs, and bring about global nuclear anarchy.

This article was published in the Economic and Political Weekly (India) and

The Friday Times (Pakistan), week of 17 April, 2006. It is published in

a slightly abbreviated form at Japan Focus on April 23, 2006.
