The Two-Mile Time Machine

Ice Cores, Abrupt Climate Change, and Our Future

Richard B. Alley

Richard Alley, one of the world's leading climate researchers, tells the fascinating history of global climate changes as revealed by reading the annual rings of ice from cores drilled in Greenland. In the 1990s he and his colleagues made headlines with the discovery that the last ice age came to an abrupt end over a period of only three years. Here he offers the first popular account of the wildly fluctuating climate that characterized most of prehistory.

Theory of Linear Poroelasticity with Applications to Geomechanics and Hydrogeology

Herbert F. Wang

The theory of linear poroelasticity describes the interaction between mechanical effects and adding or removing fluid from rock. Now this advanced text synthesizes in one place, with one notation, numerous classical solutions and applications of this highly useful theory.

Raven's Saga

An Arctic Odyssey

A novel by Peter Schledermann

In the 13th century, a threat to the way of life of the Norse Greenlanders suddenly appeared from the far north — superbly skilled Inuit hunters pursuing walrus and narwhal. From the settlement of Vesterbygd, an expedition set out to explore regions farther north than any Norsemen had ever traveled, to seek new and profitable hunting areas, and to learn about the men they called 'Skraelings.'
