**menopausal distress
can be masked...**

Appreciating the limited role of sedatives and tranquillizers in what is essentially a metabolic disturbance, physicians are turning increasingly to the treatment that masters the immediate symptoms of depression and irritability and acts at a fundamental level as prophylaxis against the long-term consequences of ovarian-pituitary imbalance.

'Today when the average woman can expect to reach her threescore years and ten, it would seem unrealistic to deny hormone treatment, which not only alleviates all the troublesome and antisocial symptoms of the menopausal and postmenopausal phases but is also a prophylactic measure against osteoporosis, senile vaginitis, hypertension, and coronary heart disease, to mention but a few hazards of oestrogen depletion.'¹

or mastered

Mixogen

The arguments against the use of plain oestrogen therapy – endometrial bleeding and nausea – are countered when Mixogen is used.

'Perhaps the best way of avoiding oestrogenic bleeding is to use one of the oestrogen-testosterone combinations, of which the original – Mixogen – is the best.'²

Studies in Psychiatry

*A Survey of Work carried out in the
Department of Psychiatry of the Institute
of Psychiatry, under the Chairmanship of
Sir Aubrey Lewis, 1945-66*

Edited by MICHAEL SHEPHERD

*Professor of Epidemiological Psychiatry,
Institute of Psychiatry, University of
London*

and D. L. DAVIES

*Physician, The Bethlem Royal and
Maudsley Hospitals*

In his twenty-one years as Professor of Psychiatry at the Institute of Psychiatry in the University of London, Sir Aubrey Lewis succeeded in laying the foundations of academic psychiatry in Great Britain. Some notion of his vision can be obtained from this collection of essays, spanning a wide area of time, written for the most part by senior members of the Department of Psychiatry whose research and studies were initiated under the guidance of Sir Aubrey Lewis. The quality and scope of the work carried out has been recognized by medical authorities outside the United Kingdom, and these essays are an essential source of knowledge for everyone interested in British psychiatry and its most distinguished exponent.

The Classification of Depressive Illnesses

R. E. KENDELL

*Lecturer, Institute of Psychiatry,
University of London*

The author describes a series of studies designed to clarify the prolonged controversy over the classification of depressions. Data from a series of over a thousand patients with depressive illnesses were analysed in several different ways to test the validity of existing diagnostic criteria. The differences in symptomatology, treatment and outcome of different diagnostic categories were studied and the successive illnesses of patients with recurrent depressions were compared.
