"We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions."—*British Medical Journal*, May 3, 1890.

# LISTERINE

*A safe, non-poisonous, unirritating  
antiseptic solution*

**LISTERINE** is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle, or douche, in catarrhal conditions of the nose and throat.

**LISTERINE** in proper dilution may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

**LISTERINE** embodies a two-fold antiseptic effect, in that after the evaporation of its volatile constituents—thyme, eucalyptus, mentha, gaultheria, and ethyl alcohol—a film of boracic and benzoic acids remains upon the surface to which Listerine has been applied, affording more prolonged antiseptic protection.

**LISTERINE** is a trustworthy surgical dressing; it has no injurious effect upon the tissues in which the healing process is going on.

**LISTERINE** in teaspoonful doses will often afford relief in fermentative dyspepsia, and is largely prescribed, with excellent results, in the various forms of diarrhœa occurring in infants and adults.

**LISTERINE** literature, including special pamphlets upon *Respiratory Diseases*, may be had, by physicians, upon application to

## 'POLLACCINE' TREATMENT OF HAY FEVER

(Pollen Vaccine).

The method of treating Hay Fever by inoculation with 'Pollaccine' (pollen vaccine), introduced by Noon and elaborated by Freeman,<sup>1</sup> has been employed with excellent results by very many practitioners, some of whom have recorded their cases in medical journals.<sup>2</sup>

'POLLACCINE' is prepared in the Department for Therapeutic Inoculation, St. Mary's Hospital, London, W., and is supplied to the profession through the agency of Parke, Davis & Co.

As individuals differ widely in their susceptibility to pollen toxin, the dose of 'Pollaccine' appropriate to a given case should be ascertained by the ophthalmic-reaction, the requisites for which are supplied in a convenient HAY FEVER REACTION OUTFIT.

<sup>1</sup> Vide 'Lancet,' 1911, I, 1572; II, 814; also 1914, I, 1178.

<sup>2</sup> Vide 'Lancet,' 1912, II, 1716; 'Practitioner,' February, 1914; 'Liverpool Med.-Chir. Journ.,' July, 1914, p. 260.

A leaflet describing the mode of conducting the ophthalmic test, and of determining the required dose of 'Pollaccine,' will be forwarded on request by
