

## Appendix

### *Comparative Deinstitutionalization Data Set – Codebook and Source Information*

#### DESCRIPTION AND AIMS

This original database compares the process of psychiatric deinstitutionalization across 16 advanced economies with standardized, cross-national data from 1935 to at least 1990. As such, the data allows researchers to better understand the varying patterns of change in mental health care services over time as well as across countries.

As noted in Chapter 2, these countries are the first movers: societies whose early industrialization prompted the rise of the asylum, and whose extraordinary economic prosperity in the 20th century prompted its decline. Their national trends eventually set the international standard. To quantitatively delineate the universe of cases, I selected the most affluent democracies of the postwar period by examining their GDP per capita in 1960. According to the Comparative Welfare States Data Set (Brady et al. 2020), this indicator exceeded \$12,000 in all countries, averaging around \$17,000 in the set (standard deviation: about \$4,000, all amounts standardized to contemporary USD; per BLS 2023). A relatively tight distribution, the next wealthiest country on the list (Italy) is almost a full standard deviation (0.7) less than the lowest unit in the range (Finland). Italy is nonetheless included because its 1978 Basaglia law gained attention as a bellwether of the international deinstitutionalization movement (Donnelly 1992; Foot 2015). Moreover, the law was a byproduct of earlier deinstitutionalization trends in the more industrialized North, which paralleled those of the other countries in this study. Italy's spatially unequitable economic development likely delayed the law's adoption at the national level. Countries with a population

less than 1 million (micro-states) are excluded from the dataset (e.g., Luxembourg).

The dates of the data set span the full-time period during which mental health services transformed. The Second World War was a major turning point in the history of social welfare: The spirit of reform, combined with an economic boom, made for considerable policy changes, especially in the area of mental health. The development of social insurance funds, the increasing medicalization of psychiatry, and the return of war veterans facing profound psychological distress prompted reforms in the asylum. Because this flurry of activity occurred after the war, the series begins in 1935 to obtain a baseline measure of institutionalization. Tracking the series through 1990 captures the effects of the welfare retrenchment since the economic crises of the 1970s, which also prompted reductions in psychiatric care supply. Data on psychiatric hospitals and residents, for example, were much more prevalent in the earlier period than in the later period, when countries started to replace those numbers with data on psychiatric beds and inpatients.

To obtain the requisite information, a research team surveyed national statistical yearbooks for the full universe of cases from 1935 to 1990, supplemented by other official government reports as well as data from the WHO and OECD. Data was recorded in approximately five-year increments, or as otherwise noted. The series mostly describes changes in public (not private) institutions. Country-by-country details about context-specific definitions, measurement, data collection patterns, and source information are provided in the following table.

Country	Residents	Mental hospitals	Psychiatric beds	Comments	Source(s)
Australia	1935-41: Number of patients on books at end of year in hospitals for the insane 1945-60: Number of mental hospitals 1965-74: Psychiatric centers, psychiatric hospitals, and mental hospitals (excludes institutions labeled "private," in particular the New South Wales private psychiatric centers) 1990-2012: (Number of) public psychiatric hospitals	1935-41: Number of hospitals for the insane 1945-60: Number of mental hospitals 1965-74: Psychiatric centers, psychiatric hospitals, and mental hospitals 1990-2000: Available beds in public psychiatric hospitals 2005: Mental health hospital beds in public psychiatric hospitals 2012: Beds in public psychiatric hospitals	1935-41: Number of beds and cots in hospitals for the insane 1945-60: Number of beds and cots in mental hospitals 1965-70: Number of beds and cots for patients in mental health inpatient institutions 1990-2000: Available beds in public psychiatric hospitals 2005: Mental health hospital beds in public psychiatric hospitals 2012: Beds in public psychiatric hospitals	Since most of the earlier data (1935-60) appear to exclude data on private institutions, we continued to exclude private institutions for subsequent years (1965-2012). Data for private institutions, though, is available for most of those more recent years as well.	Commonwealth Bureau of Census and Statistics, <i>Official Yearbook of the Commonwealth of Australia</i> (1935-2012).

Country	Residents	Mental hospitals	Psychiatric beds	Comments	Source(s)
		1950: Public mental institutions 1955-75: Public mental hospitals 1978: (Reporting) public mental hospitals 1986: Number of mental hospitals (excludes Prince Edward Island, Yukon, and NW Territories; data for Quebec includes allied special, rehabilitation, and extended care hospitals)			
Denmark	Complete series not available	1935: State mental hospitals 1945-75: State, municipal, and private mental (psychiatric) hospitals	1945-75: Beds in state, municipal, and private mental (psychiatric) hospitals 1985-95: Beds in psychiatric hospitals, total		Danmarks Statistik, <i>Statistisk Årbog</i> . (1937-97).

## Finland

1935-5: Male and female mental defectives in state hospitals, communal hospitals, private hospitals, communal institutions, and private homes  
1988: Since resident data is not available for the end of the series, we estimate it for this year.  
Average length of stay remained high in Finland (125.1 days this year), so we interpret the bed occupancy rate multiplied by the number of mental hospital beds as an acceptable, if imperfect, indicator of the resident population in this year

1936-40: Total number of state, municipal, and private mental hospitals in cities and in the countryside  
1945-90: Total number of state, communal, and private mental hospitals

1935: Since bed data is not available for the beginning of the series, we estimate it for this year. In the years following the Second World War (1945-50), beds in mental hospitals accounted for about 30 percent (29.6-30.02 percent) of the total number of beds in Finland. The psychiatric bed estimate for 1935 is 30 percent of the total number of general and other hospital beds in that year.  
1945-90: Number of beds in state, communal, and private mental hospitals

Although data is often subdivided by institutional type (e.g., state, communal, or private hospital; as well as charity and in-home care), it is not consistently so. We hence provide data for all psychiatric institutions, though most services are provided at the municipal (communal) level. Note also that the population residing in psychiatric care often doubles the number of psychiatric beds. The reason for this discrepancy is unclear; however, it appears that during this period some residential care was available in non-hospital institutions (e.g., charities and private homes).

Country	Residents	Mental hospitals	Psychiatric beds	Comments	Source(s)
Great Britain	1938: Registered persons of unsound mind at January 1 in Institutions provided by County and Borough Councils under the Lunacy Acts in England, Wales, and Scotland (excludes state criminal lunatic asylums and other institutions under the Poor Laws, since their purposes went beyond the medical and custodial to include punishment, commodification, etc.; also excludes data on Northern Ireland for better comparability with the latter part of the series)	Complete series unavailable	Complete series unavailable	See Jones (1983) on the challenges of collecting historical data on mental health services in the United Kingdom of Great Britain and Northern Ireland. In brief, the Mental Health Act of 1959 significantly altered the basis on which mental health statistics were gathered, rendering the statistical figures before and after that year difficult to compare. Moreover, tables on key variables are often aggregated and disaggregated in succeeding years. For example, sometimes Wales and England are presented together, other times not; “psychiatric services” may or may not include services for the mentally handicapped, and children and people over the age of 65 are sometimes included or excluded;	Central Statistical Office, <i>Annual Abstract of Statistics</i> (1938–90). Government Statistical Service. <i>Health and Personal Social Services Statistics for England</i> (1978). Jones (1983).

<p>1955: Inpatient average daily occupation of beds (mentally deficient) in England, Wales, and Scotland</p> <p>1960-85: Average daily occupation of beds in psychiatric departments in England and Wales; mental and mentally deficient in Scotland</p>	<p>some localities mix the data on the mentally ill with data those with physical disabilities, mental disabilities, or even lucid but frail elderly. Additional data collection challenges arose after the late 1970s, when budgetary challenges stalled surveillance efforts. The last detailed Mental Health Inquiry for England and Wales was published in 1978 and only includes data up to then. Any other related publications either ceased publishing around this time as well, only base their information on the 1976 data, or give no mental health statistics at all.</p>
