

108.12 Proof without words: a lower bound for $n!$

$$n! = \Gamma(n + 1) = \int_0^\infty f(x) dx > \frac{1}{2}(2\sqrt{n})f(n) = \left(\frac{n}{e}\right)^n \sqrt{n}$$

108.13 Indeterminate exponentials without tears

Every calculus student learns how to solve indeterminate limits of the form $f(n)^{g(n)}$ where $f(n) \rightarrow 1$ and $g(n) \rightarrow \infty$; most quickly learn to hate and fear this process. It is error-prone, full of tedious algebra, and requires careful attention to L'Hôpital's rule. Here is a typical "fairly simple" example.

$$\begin{aligned} \lim_{n \rightarrow \infty} \ln \left(\frac{n+4}{n} \right)^{3n+1} &= \lim_{n \rightarrow \infty} \frac{\ln \left(\frac{n+4}{n} \right)}{\frac{1}{3n+1}} \\ &= \lim_{n \rightarrow \infty} \frac{\left(\frac{-n}{n+4} \right) \left(\frac{-4}{n^2} \right)}{\frac{3}{(3n+1)^2}} \text{ using L'Hôpital's rule} \\ &= \lim_{n \rightarrow \infty} \left(\frac{-4}{n(n+4)} \times \frac{-(3n+1)^2}{3} \right) \\ &= \lim_{n \rightarrow \infty} \frac{4(3n+1)^2}{3n(n+4)} = 12 \end{aligned}$$

and so

$$\lim_{n \rightarrow \infty} \left(\frac{n+4}{n} \right)^{3n+1} = e^{12}.$$
