

Definitive texts on financial analysis

BUSINESS FINANCE

Second Edition

By STEPHEN H. ARCHER and CHARLES A. D'AMBROSIO,
both, Graduate School of Business Administration,
University of Washington, Seattle

This edition continues to cover standard topics for a first course in finance and financial management. An integrated (business and economic) financial model of the world is developed so that, in the Second Edition, theory is presented as the basis of financial decision making. Thus major current trends in business management, finance, and economics are reflected. A Solutions Manual is available.

MODERN STATISTICS FOR BUSINESS AND ECONOMICS

By WILFORD L. L'ESPERANCE, The Ohio State University

This text for an introductory undergraduate course offers unusually complete coverage of such topics as Bayesian statistics, regression analysis, and decision making under uncertainty. Descriptive statistics are used to introduce important ideas in probability and random variables. Discussions of random variables, expectation, variance, and covariance provide a basis for understanding business decision analysis and regression analysis. Throughout the text, the number of proofs is kept to a minimum, and examples illustrate all the ideas. A Solutions Manual is available.

INTRODUCTION TO INVESTMENTS AND FINANCE

Theory and Analysis

By FRED B. RENWICK, New York University

This book offers a complete and up-to-date analytical and theoretical treatment of investments. The chapter on risk and uncertainty is particularly thorough. The use of mathematics and computation is kept to a minimum, and much of the methodology is included in chapter appendices.
