

Teaching Old Microscopes New Tricks

Stephen W. Carmichael¹

Mayo Clinic

carmichael.stephen@mayo.edu

There are many transmission electron microscopes (TEMs) that have provided years of reliable service and good images, but they lack the positioning systems that are standard on the newest microscopes. A precise digital positioning capability is essential for many quantitative stereological studies and relocating specific features on a grid. For many of the older TEMs, retrofitting them with a digital positioning system is not an option, or at least a very expensive upgrade. Now Martin Hohmann-Marriott, William Sharp, Robert Roberson, and Robert Blankenship have described the hardware and software that offer a second life to these older microscopes.²

The readily-available hardware can be purchased at a local electronics store, or mostly they can be scavenged from the computer mouse that plugs into the serial port. A pair of optical wheels with readouts are physically interfaced with the mechanical translators (*x* and *y* stage cranks) on the microscope and in turn hooked up to a simple computer, such as a laptop. This hardware costs about \$50, plus the computer. The programs were written in the Perl computer language that is freely available at <http://www.activestate.com/Products/ActivePerl/> to work with Windows. The programs should be available at the Microscopy Research and Technique web site at <http://www.interscience.wiley.com/jpages/1059-910X/supplmat> as supplementary materials.

Hohmann-Marriott *et al.* describe in detail how this hardware and software are integrated to create a digital positioning system. This includes hardware assembly, communication format, computer system requirements, the software environment, distance calibration, digital realignment, and position determination. They demonstrate how the system worked on two Philips microscopes, finding that the determined position deviation was about one micron or less in the *x* and *y* axes. After reloading and computational realignment, the determined position variation was less than three microns. This may not be as good as a new top-of-the-line microscope, but it clearly will make an older microscope much more useful.

This article clearly demonstrates a workable solution for upgrading TEMs with mechanically-driven stages. As Hohmann-Marriott *et al.* point out, this affordable system delivers the spatial resolution and position fidelity suitable for electron microscopic study of biologic specimens. This would be particularly practical in an electron microscopy suite where excellent older microscopes are underused and the newer microscopes with factory-installed positioning systems overbooked. Finally, this "home made" positioning system is very flexible and may be transferred to other instruments, including light microscopes, dissecting microscopes, and positioning tables.

Hohmann-Marriott *et al.* have shown that old microscopes can perform new tricks! ■

ABOUT THE COVER

The May front cover is a crystal formed by the influence of a drop of "Cherry" wine. This and over 100 other images were captured using the actual 1930's test samples from one of the top (now deceased) bootleggers of the prohibition era – who, the story goes, supplied the infamous Al Capone syndicate. The samples included "really informative names" such as "Batch 105," "Batch 76," "Cherry," *etc.*, creating images now part of the "Vicarious Bootleggers Collection," by T. H. Saunders. Images were captured using cross polarization, transmitted light with a Zeiss Axiophot and 10x/0,30 Zeiss Epiplan-NEOFLUAR HD-DIC on 35mm Fuji Realla 100 negative film. Only minimal Photoshop contrast enhancement was applied. This and other Saunders Collections images will be on display and sale at the July M&M 2006 meeting in Chicago – all net proceeds benefitting the MSA Undergraduate Scholarship Fund.

MICROSCOPY TODAY

The objective of this publication is to provide material of interest and value to working microscopists!

The publication is owned by the Microscopy Society of America (MSA) and is produced six times each year in odd months, alternating with MSA's peer-reviewed, scientific journal *Microscopy and Microanalysis*. We greatly appreciate article and material contributions from our readers—"users" as well as manufacturers/suppliers. The only criterion is that the subject matter be of interest to a reasonable number of working microscopists. *Microscopy Today* has authors from many disparate fields in both biological and materials sciences, each field with its own standards. Therefore *MT* does not have a rigid set of style instructions and encourages authors to use their own style, asking only that the writing be clear, informative, and accurate. Length: typical article length is 1,500 to 2,000 words plus images, longer articles will be considered. Short notes are encouraged for our Microscopy 101 section.

Crystal clear answers from Thermo's FT-IR and Raman Microscopes

Show us your smallest sample and we'll show you the highest spectral purity in every sampling mode.

Infrared. Raman. Polarized Light. White Light. Fluorescence. Thermo has the optimum microscopy system for your most demanding challenge.

With power, speed and crystal-clear output, our flexible instruments and imaging software minimize sampling errors and give you confidence in the most advanced results possible.

Start seeing what you're missing. Take a look at Thermo's collection of microscopy innovations. Contact Thermo at 1-800-532-4752, email analyze@thermo.com or visit www.thermo.com/microscopy_ad.
