The object: The object of this research is to determine the relation among characteristic specialty and happiness feeling in Talasemi persons. (Major).

Materials and methods: The design of this research, is descriptive and correlation one. The society of research includes: All talasemi persons of major kind in which are treating in Amir kola Talasemi center in 2011 in which about 150 persons has been selected by simple collision sampling by the aid of Morgan table. We have used of Pierson correlation and multi-linear regression analysis in analyzing dates. Also, for gathering dates, referred persons completed five neo factors of characteristic questionnaire and oxford happiness questionnaire.

Findings: Based on regression findings, neo characteristic and happiness of talasemi person indicators is about 0.45 in which shows linear correlation among neo-characteristic and happiness variables in Talasemi persons in which there is meaningful relation among characteristic specialty. (Psycho-anger, extroverts, flexibility, agreeability, responsibility).

Conclusion: Among characteristic specialties, extroverts, flexibility, agreeability, responsibility, there is positive meaningful relation to happiness in which it means the less psycho-anger is equal to more happiness.
