Creating Abundance

Biological Innovation and American Agricultural Development

ALAN L. OLMSTEAD, *University of California, Davis*

PAUL W. RHODE, *University of North Carolina, Chapel Hill*

"This is an important book! It traces the stream of biological innovation that over a period of two centuries has transformed the technical landscape of American agriculture. It will be the standard against which the next generation of research in the history of agricultural technology will be evaluated."

—Vernon W. Ruttan, *Regents Professor Emeritus, Department of Applied Economics and Department of Economics, University of Minnesota*

"In *Creating Abundance* Alan Olmstead and Paul Rhode examine an important, but often neglected, aspect of American economic growth over the course of several centuries. Based on extensive research in a large variety of primary and secondary sources, including numerous state and national agricultural reports and related private documents, they describe in great detail the important biological developments influencing crop and livestock productivity. This is an original and superb work of scholarship. This book should be of interest to all economic historians, historians, and agricultural economists."

—Stanley L. Engerman, *John H. Munro Professor of Economics and Professor of History, University of Rochester*

"In an era focusing on sustainability and climate change, *Creating Abundance* should be required reading for environmentalists, economists, and policy makers, as well as for economic, environmental and technological historians (and their students). The culmination of nearly two decades of extensive, patient, and inclusive research, *Creating Abundance* combines theoretical sophistication with a supple writing style to illuminate both a host of planning/policy advances and errors and the centrality of engaged practitioners' efforts in building flexible and responsive relationships with the natural world."

—Philip Scranton, *Board of Governors Professor, History of Industry and Technology, Rutgers-Camden; Editor-in-Chief, Enterprise and Society*

This book demonstrates that American agricultural development was far more dynamic than generally portrayed. In the two centuries before World War II, a stream of biological innovations revolutionized the crop and livestock sectors, increasing both land and labor productivity. Biological innovations were essential for the movement of agriculture onto new lands with more extreme climates, for maintaining production in the face of evolving threats from pests, and for the creation of the modern livestock sector. These innovations established the foundation for the subsequent Green and Genetic Revolutions. The book challenges the misconceptions that, before the advent of hybrid corn, American farmers single-mindedly invested in laborsaving mechanical technologies and that biological technologies were static.
