

Cooperative System between NGOs and the Private Sector for Disaster Relief in Japan

Dr. Kimiko Yamashita

Chibune General Hospital, Osaka City, Japan

Introduction: Disasters disturb the balance of medical supply and demand. Because normal supply chains break down in the wake of disasters, it is difficult to deliver daily necessities to affected areas. In addition, without a reliable supply of medical equipment and medicines, the number of sick and injured patients increases.

Aim: We propose that emergency medical teams should bring medical equipment and daily necessities when responding to disasters.

Methods: The Social Emergency Management Alliance (SEMA) was established in 2017. SEMA is a cooperative system between NGOs and the private sector for disaster relief in Japan. Humanitarian Medical Assistance (HuMA) utilized this system to provide emergency medical assistance during the Western Japan Floods in 2018.

Results: After the flooding, increased amounts of dust caused many cases of conjunctivitis. There were also numerous cases of heat stroke and dehydration, especially in the elderly. We requested SEMA to bring eye drops to wash out dust and isotonic drinks to prevent dehydration and heat stroke to Mabi Town, Okayama. SEMA coordinated with the private sector to provide eye drops and isotonic drinks via a forwarding agent, and we were able to distribute them to affected people and prevent worsening disease.

Discussion: NGOs working within affected areas can assess the exact needs of affected people in order to avoid waste. Such collaboration through SEMA will allow for more effective disaster relief in the future. It is our hope that more private companies join SEMA to reduce the suffering of disaster victims.

The Core Concepts of an Integrated Information System for Disaster Medical Assistance Teams: Ten-Year Experience in Taiwan

Dr. Chih Hsien Wu¹, Dr. Chien Hao Lin¹, Mr. Hsin Fu Chen¹, Dr. Frank Fuh Yuan Shih¹, Dr. Ming Tai Cheng¹, Dr. Wei Kuo Chou¹, Dr. Hung Chieh Liu², Dr. Shu Hsien Hsu¹

Introduction: Information systems (IS) have facilitated workflow in the health care system for years. However, the utilization of IS in disaster medical assistance teams (DMATs) has been less studied.

Aim: In Taiwan, we started a program in 2008 to build up an information system, MEDical Assistance and Information Dashboard (MED-AID), to improve the capability and increase the efficiency of our national DMAT.

Method: The mission of our national DMAT was to provide acute trauma care and subacute outpatient care in the field after an emergency event (e.g., earthquakes). We built the IS through

a user-oriented process to fit the need of the DMAT. We first analyzed the response work in the DMAT missions and reviewed the current paperwork. We evaluated the eligibility and effectiveness of the core functions of DMATs by experts in Taiwan and then developed the IS. The IS was then tested and revised each year in two table-top exercises and one regional full-scale exercise by the DMAT staffs who came from different hospitals in Taiwan.

Results: During the past 10 years, we identified several core concepts of IS of DMAT: patient tracking, medical record, continuity of care, integration of referral resources, disease surveillance, patient information reporting, and medical resources management. The application of the IS facilitate the DMAT in providing safe patient care with continuous recording and integrate patient referral resources based on geographic information. The IS also help the planning in real-time disease surveillance and logistic function in the medical resources monitoring.

Discussion: Information systems could facilitate patient care and relieve the workload on information analysis and resources management for DMATs.

Core Curriculum for Event Medical Leaders

Dr. Adam Lund¹, Dr. Matthew Brendan Munn¹, Dr. Jamie Ransie², Dr. Sheila Turris¹

1. University of British Columbia, Vancouver, Canada
2. Griffith University, Gold Coast, Australia

Introduction: The literature on mass gatherings has expanded over the last decade. However, no readily accessible curriculum exists to prepare and support event medical leaders. Such a curriculum has the potential to align event medical professionals on improving event safety, standardizing emergency response, and reducing community impacts.

Methods: We organized collaborative expert focus groups on the proposed “core curriculum” and “electives.”

Results: Key features of a mass gathering medical curriculum include operations-focused, evidence-informed, best-known practices offered via low barrier, modular, flexible formats with interactive options, and a multi-national focus.

Core content proposed:

- Background (Definitions, Context, Risk, Legalities)
- Event Medical Planning - “The Seven Steps” - (1.) Assessment and Environmental Scan - Event Emergency Action Plan, (2.) Human Resources, (3.) Equipment/Supplies, (4.) Infrastructure/Logistics, (5.) Transportation (To, On, From), (6.) Communication (Pre, During, Post), and (7.) Administration/Medical Direction
- Event After-Action Reporting
- Case-based Activities

Electives mirror Core outline and serve as expanded case-studies of specific event categories. Initially proposed electives include:

- Concerts/Music Festivals
- Running Events
