The impact of personality dysfunctions in neurotic/anxiety disorders, especially in chronic and recurrent ones, are evident. Those dysfunctions seems to be different from specific personality disorders, being frequently co-morbid with neurotic disorders.

Research on personality traits associated with neurotic syndromes led to construction of neurotic personality questionnaire (KON-2006). The usefulness of this diagnostic tool was assessed in Polish, Czech and Russian populations.

The paper presents the results of studies on neurotic personality traits measured by this questionnaire and the results of a comparative study in Polish, Russian and Czech populations as well as the clinical experience with the use of this instrument in diagnosis and therapy (psychotherapy) outcome assessment.
