

Instructions for contributors

Robotica aims to be an outlet for publication of original papers of the highest quality in the field of Robotics and closely related areas. This includes: novel robotic mechanism and actuator design; robot kinematics, dynamics and control; computer vision; sensor fusion; teleoperation and haptic interfaces; robot motion planning; and artificial intelligence. In addition, papers that apply techniques from Robotics to other fields are also welcome. Examples include dynamics and control models applied to biological systems, the description of implementations of robots in factories, service and agricultural settings, and general mechatronic design. Works may be theoretical, computational or experimental, or some combination. Both short papers (rapid communications), and longer archival papers are welcome. Proposals for special issues on topics of current interest are welcome, and can be submitted via email to the editor.

Authors are urged to ensure that their papers are written clearly and attractively, in order that their work will be readily accessible to readers. Manuscripts must be written in English. *Robotica* employs a rigorous peer-review process whereby all submitted manuscripts are sent to recognized experts in their subjects for evaluation. The Editor's decision on the suitability of a manuscript for publication is final. Manuscripts, whether accepted or rejected, will not be returned to authors.

Submission of manuscripts

Manuscripts for consideration by *Robotica* should be submitted electronically, using the Manuscript Central System, via <http://mc.manuscriptcentral.com/cup/robotica>. This system will allow authors to benefit from faster review and earlier, online publication. The system will accept PDF files; most other file types will be automatically converted directly into PDF. Source files are required for any paper accepted for publication. Authors who are unable to submit online should contact the Editorial Office (robotica@cambridge.org) for assistance.

Submission of a paper is taken to imply that it has not been previously published and that it is not being considered for publication elsewhere. Upon acceptance of a paper, the author will be asked to transfer copyright to the publisher. Authors are responsible for obtaining written permission from the copyright owners to reprint any previously published material included in their article.

Layout of manuscripts

Text should be double spaced throughout, on one side of the paper, allowing generous margins on all sides of the paper. Please avoid footnotes if possible. Papers should begin with an abstract of not more than 100 words and should end with a brief concluding section. The title and section headings should be concise and descriptive. All measurements should be given in SI units. On acceptance of a manuscript, authors are asked to send the electronic source file of the final version together with a PDF copy produced using the same file. The publisher reserves the right to typeset material by conventional means if an author's file proves unsatisfactory.

Illustrations

Figures should be composed to occupy a single column (80mm) or two columns (166mm) after reduction. The preferred format for figure files is .eps or .tiff at resolution 1200 dpi for lines, 600 dpi for greyscale and 300 dpi for colour (which preferably should also be in CMYK – cyan magenta yellow black – format). However,

most standard image formats such as pct, ppm, png, psd, Word, ppt, CorelDraw, ChemDraw, AutoCAD can also be used, but not customized output of software not designed for publishing purposes such as Matlab, nor PDF. Figures to be printed in black and white must be submitted as black and white files.

Figures should be numbered consecutively, with Arabic numerals, have descriptive captions, and be mentioned in the text. A list of captions should be attached separately, and as far as possible, information relating to a figure should be placed in the caption rather than on the figure. Each figure should be clearly numbered. Photographs should be the same size as they will appear in the journal and should be selected to fit neatly into one column (80 mm) or two columns (166 mm). Photographs should be clearly identified and numbered as for line drawings.

Tables

Tables should be presented on separate sheets. A descriptive title should be given to each table. If possible, very wide tables should be avoided. Tables should be numbered consecutively in Roman numerals. Exceptionally lengthy tables may be summarized for publication with a note that fuller details can be obtained from the authors.

Equations

Mathematical equations should be typewritten, with subscripts and superscripts clearly indicated. All mathematical symbols will be set in italics unless otherwise indicated: symbols or letters to be set in Roman (upright) type should be marked clearly.

References

In the text, references are indicated by superior Arabic numbers (without brackets), and should be confined to published work that is directly pertinent. References should be listed at the end of the paper in numerical order. Authors' initials should precede their names: cited article titles should be quoted in full, enclosed in quotation marks; and abbreviations of journal names should follow the style of Chemical Abstracts or Physical Abstracts, and be underlined for italics:

P.W. Anderson, "More is different" *Science* **177**, 393-399 (1972);
C.V. Negoita, *Fuzzy Systems* (Abacus Press. Tunbridge Wells, UK, 1980).

Citations such as 'personal communication', 'unpublished work', etc., are not acceptable as numbered references but can be included in parenthesis in the text. Do not use summaries as references.

Proof Reading

The corresponding author will receive PDF copies of page proofs for final proofreading. Only typographical or factual errors may be changed at proof stage. The publisher reserves the right to charge authors for correction of non-typographical errors. Authors are requested to return proofs within 48 hours by airmail. No page charge is made.

Offprints

No paper offprints are provided, but the corresponding author will be sent the pdf of the published article. Print offprints may be purchased at extra cost at proof stage.

ROBOTICA

Volume **40** Part **6** June **2022**

An optimal visual servo trajectory planning method for manipulators based on system nondeterministic model Ruolong Qi, Yuangui Tang, and Ke Zhang	1665
A novel method of shuttlecock trajectory tracking and prediction for a badminton robot Junming Zhi, Deyuan Luo, Kui Li, Ya Liu and Huaqiu Liu	1682
Coordinated control of a 3DOF cartesian robot and a shape memory alloy-actuated flexible needle for surgical interventions: a non-model-based control method Fan Liang, Bryan J. Traughber, Tithi Biswas, Gordon Guo, Raymond F. Muzic and Tarun K. Podder	1695
Kinetostatic backflip strategy for self-recovery of quadruped robots with the selected rotation axis Shengjie Wang, Kun Wang, Chunsong Zhang and Jian S Dai	1713
FAT-based robust adaptive control of cooperative multiple manipulators without velocity measurement Ali Deylami and Alireza Izadbakhsh	1732
Design and motion control of an under-actuated snake arm maintainer Guodong Qin, Aihong Ji, Yong Cheng, Wenlong Zhao, Hongtao Pan, Shanshuang Shi and Yuntao Song	1763
Kinematic analysis of overconstrained manipulators with partial subspaces using decomposition method Özgün Selvi	1783
Variable-time-interval trajectory optimization-based dynamic walking control of bipedal robot Erman Selim, Musa Alci and Mert Altıntaş	1799
Numerical and experimental performance estimation for a ExoFing - 2 DOFs finger exoskeleton G Carbone, M Ceccarelli, C. E. Capalbo, G Caroleo and C Morales-Cruz	1820
Development of a revolute-type kinematic model for human upper limb using a matrix approach Anil Kumar Gillawat	1833
Effective motion planning of manipulator based on SDPS-RRTConnect Junxiang Xu and Jiwu Wang	1855
Observer design for apex height and vertical velocity of a single-leg hopping robot during stance phase Ashish Prakash and Gagan Deep Meena	1868
Impedance matching control between a human arm and a haptic joystick for long-term Jiwook Choi, Zhanming Gu, Jangmyung Lee and Inho Lee	1880
Modelling, simulation and implementation of a hybrid model reference adaptive controller applied to a manipulator driven by pneumatic artificial muscles Marcelo Henrique Souza Bomfim, Neemias Silva Monteiro and Eduardo José Lima II	1894
Intelligent cooperative collision avoidance via fuzzy potential fields Daegyun Choi, Anirudh Chhabra and Donghoon Kim	1919
Effect of operating parameters of a magnetically controlled spiral capsule robot on its performance Liang Liang, Puhua Tang, Yu Liu and Yan Xu	1939
Adaptive control for networked uncertain cooperative dual-arm manipulators: an event-triggered approach Mohamed Abbas and Santosha K. Dwivedy	1951
A nonlinear optimal control approach for underactuated power-line inspection robots Gerasimos Rigatos, Nikolaos Zervos, Pierluigi Siano, Masoud Abbaszadeh, Jorge Pomares and Patrice Wira	1979
Vision-based kinematic analysis of the Delta robot for object catching Sachin Kansal and Sudipto Mukherjee	2010
Vision-based pose estimation of craniocervical region: experimental setup and saw bone-based study Mohammad Zubair, Sachin Kansal and Sudipto Mukherjee	2031
Development of a linear-parallel and self-adaptive under-actuated hand compensated for the four-link and sliding base mechanism Jianfeng Li, Yuan Kong, Mingjie Dong and Ran Jiao	2047
Improving RGB-D SLAM in dynamic environments using semantic aided segmentation Lhilo Kenye and Rahul Kala	2065

Robotica now accepts submissions via Manuscript Central
