

dent reduction of synonyms, "author's words," and eponyms.

Generally, the terminology of DM depends on the: 1) character of the disasters (natural, technologic, wartime, social); 2) new foreign terms, mostly of English origin, that are transformed into their Bulgarian equivalent either through their translation into Bulgarian, or through their transcription in Cyrillic; 3) school under whose influence the Bulgarian medical science and public health are in a certain period of time; 4) degree of collaboration with foreign institutions and specialists; and 5) development of the military and civil industries. It is evident that the DM terminology is multidisciplinary and dynamic, and the terms are not defined sufficiently and unified not only in Bulgarian, but also in any other language.

Computer Applications in Disaster Medicine: E-Mail Link With Besieged Sarajevo

*Emesto A. Pretto, MD, Mirsada Begovic, MD, PhD, Nermin Zukic**
Safar Center for Resuscitation Research, University of Pittsburgh, Pittsburgh, Pennsylvania USA
*University of Western Ontario, London, Ontario, Canada.

The emergence of advanced telecommunications and computer technology has allowed the creation of a global electronic mail (e-mail) network for the exchange of information called the "Internet." In this report, we describe the initial development in early 1994, of an e-mail network in the city of Sarajevo (SaraNet) that is under a military and information blockade. It is used by private individuals, several local and international health and humanitarian relief agencies, local authorities, and other organizations. The main system is PC-based (486/66 MHz, 16 MB RAM, 1 GB HDD/CD-ROM-equipped computer with a high speed modem [v.32bis/v.42bis]) relying on satellite phone link for transmission of electronic signals to Geneva, re-routed to a central node in Germany, and then to the rest of the world via the Internet and other networks. The main unit in Sarajevo is connected via local phone lines to approximately 650 users equipped primarily with 286-based computers and 2,400 bps modems. This experience illustrates the feasibility and importance of using e-mail systems for needs assessment, public health surveillance, and planning and coordination of humanitarian relief operations in disasters, especially when the conventional means of communication are limited or nonexistent. Disaster field teams should be equipped with portable, rechargeable, battery-powered (with back-up solar energy cells), satellite-based telecommunications and computer systems.

Medical Aspects of Disaster Preparedness to Strong Earthquakes on the Kamchatka

Mark A. Klyachko, PhD,¹ Max M. Raisman, MD²

¹Centre on EQF and NDR, Russia

²Regional Medical Department, Petropavlovsk, Russia

The Kamchatka Peninsula is the most seismic-prone zone of Russia. Moreover, the official prognosis of nearest earthquake (EQ) with Richter's magnitude $M > 8$ was declared in 1987 for adjoined part of Pacific Seismic Rim.

Located around Avacha Bay, Petropavlovsk-City has a population about 300,000 and is extremely vulnerable to earthquakes and numerous secondary, natural (tsunami, snow avalanches, landslides, rock falls, soil liquefaction, etc.) and man-made (fires, explosion, chemical, and radioactive contamination) disasters.

It was necessary to evaluate and analyze the risk, and then develop and implement the urgent preventive measures to mitigate the effects of possible disasters. We can prevent human losses and suffering, i.e., ensure the medical readiness to disaster.

Taking into account the triggered by earthquake multiple disasters and using the developed Disaster Scenarios (DISC) technique, we have devised a disaster formatting process, and have estimated both the amount and distribution of human losses, i.e., the killed and injured peoples. Analysis of medical staff losses also has been carried out. New approaches to damage and losses estimation were used. Developed and refined on the basis of DISC the list of medical needs and disaster preparedness and elimination plans are presented.

Triage Manual of Kitasato University Hospital in Japan

Katsuhiko Sugimoto, MD, Takeo Ohta, MD, Tadasu Sakai, MD and Takashi Ohwada, MD

The Committee of Triage Manual of Kitasato University Hospital, Department of Traumatology and Critical Care, Kitasato Sagamihada Kanagawa, Japan

In Japan, there are many natural disasters, such as earthquakes and volcano eruptions. Recently, a triage manual has been established by the committee of the triage manual of Kitasato University Hospital to prepare for natural disasters. Principally, an evacuation protocol was designed to move patients in the hospital to the field tents (1,000-bed capacity) on the ground near the hospital. The general evacuation protocol has been classified into three steps:

- I. In the first step (first-site triage), the patients in the hospital will be classified into four groups by the triage officer:
 - #1 (White) Those whose diseases/injuries are so slight that they can be managed by self-help;
 - #2 (Green) Those whose disease/injuries require medical evacuation without stretcher;
 - #3 (Yellow) Those whose diseases/injuries requires medical evacuation with stretcher; or
 - #4 (Red) Those whose disease/injuries require intensive care medicine (e.g., on a respirator).

These patients will be evacuated to field tents according to the degree of evacuation categories.

- II. In the second step (second-site triage), the patients in the field tent will be reevaluated and classified into five groups.
 - #1 (White) Require no treatment;
